

Solo ST Tine Point Options.

The ST Solo tine has 2 main knock on point options, as follows:

100mm tip, P13135. See picture below

This tip gives the combination of low draft and good disturbance, at medium to deep settings (100mm to 150mm below discing depth).

225mm tip, P12713. See picture below

This tip enables the entire soil profile to be structured across the working width, even when working the tines just deeper than the discs (see picture below). For less cohesive or moister conditions choose this wider point to ensure the profile is structured consistently across its full width.
